Product Description

Triton RAC-FO-A07-X1 - Wall-Mounted FO Box This steel wall-mounted fiber-optic box with 2 divided sections (each has its own lock with unique key) is intended for the termination and connection of fiber-optic cables in data and telecommunication applications.

The larger section is designed for incoming and outgoing cables and inside there is a holder for splice cassettes for welding of fiber-optic cables. The cables are coming into this section via the body casing and are sealed by grommets. The smaller section is designed for the connection of fiber-optic cables using patch-cords and adapters. The adapters are installed on the middle dividing panel.

Because the type of connectors is usually not known in advance, 3 panels for the most used connectors (24x ST, 24x SC and 16x SC-Duplex) are part of the box. Both sections are sealed against dust by PUR sealing around the door and the special construction of the frame. The smaller section can be used as a lead-through (the connecting cables lead out through the slot under the door and lead to the next device) or completely closed and then dust-proof as well. This depends on the used modules; material for both versions is included in the delivery.

Supply

- 4x screws 4x30
- 4x plastic washers 4,2
- 4x dowels 8
