

Item no.: WIMOUNT

Solid WiMount bracket

from **9,22 EUR**

Item no.: WIMOUNT
shipping weight: 0.70 kg
Manufacturer: QuWireless

Product Description

Wireless Instruments basing on strong experience on many installation sides, resolved to change the standard way (using by most of the manufacturers) of producing mounting systems from steel (an angle-iron). The company decided to design much more solid mounting system, which You need to be certain that Your installation is safe, WiMount ensures much stronger antenna stability during strong winds. That way was the WiMount designed. The standard bracket for WiBOX series is made from very solid material with high content of fiberglass, which makes it much more durable than standard steel bracket or magnesium cast (it is susceptible for cracking). This solution enables mast mounting (the diameter up to 62mm) and wall mounting (the distance between the mounting holes – 75mm). The mounting system consists of three parts, which enables the adjustment in two planes, also in case of wall mounting. The adjustment is possible in the range of 70 degrees (35+35), which practically meets the users requirements, simultaneously ensuring the full durability and constant parameters of the mounting system. The WiMount is scaleable, which means that You can increase the adjustment range by adding WiMount elements. The DC ground of the whole box system is enabled by the bracket (there is the grounding wire inside the mount). To make the antenna pointing more accurate, the angle scale is added on the moving parts.
